

A06: Entertainment and Media Module Reflections

Industry Overview

The entertainment and media industry is responsible for creating and distributing content such as movies, television shows, music, video games, news, and digital media. It serves a wide range of audiences by providing information, education, and entertainment. Today, the industry reaches billions of people through streaming platforms, social media, and online content services.

Because technology continues to change how people consume media, the entertainment industry has become one of the most important areas for artificial intelligence adoption. AI is helping companies create content faster, personalize user experiences, and improve production processes while reducing costs.

Current AI Trends

Artificial intelligence is currently being used in several ways throughout the entertainment and media industry. One major application is AI-generated music. Tools such as Suno, Udio, and AIVA can create original songs, melodies, and instrumentals from simple text prompts. These systems help musicians overcome creative blocks and allow people without formal music training to create professional-sounding music. AI is also being used in music production for tasks such as mixing, mastering, and pitch correction, making the production process faster and more affordable.

Another major trend is personalized content recommendation systems. Companies such as Netflix and Spotify use AI algorithms to analyze user behavior, viewing history, ratings, and listening habits. These recommendation systems suggest movies, television shows, and music

that users are likely to enjoy. This improves user satisfaction while helping companies increase engagement and retention.

A third trend involves deepfake and digital recreation technologies. AI can generate realistic images, videos, and voices that imitate real people. In the entertainment industry, these technologies have been used to de-age actors, recreate historical figures, and even digitally resurrect deceased actors. Examples include the use of AI-generated versions of actors such as James Dean and technologies that allow filmmakers to create realistic visual effects without traditional methods. While these tools offer creative opportunities, they also raise significant ethical concerns.

Ethical Implications

One major ethical concern is consent and ownership. AI systems can replicate a person's face, voice, or likeness with remarkable accuracy. This becomes especially controversial when the individual is deceased and cannot provide consent. The use of AI-generated versions of actors and celebrities raises questions about who owns a person's digital identity and who has the authority to approve its use after death. Similar concerns exist when companies create AI versions of deceased family members for grieving relatives.

Another ethical concern is job displacement. AI-generated music, writing, visual effects, and voice acting may reduce the demand for certain creative professionals. While AI can increase efficiency, many artists, musicians, writers, and performers worry that companies may choose lower-cost AI alternatives instead of hiring human talent. This could reduce opportunities for creative workers and change the nature of artistic careers.

Privacy and misinformation are additional concerns. Deepfakes can be used to create convincing fake videos or audio recordings that appear authentic. These technologies can spread misinformation, damage reputations, and make it difficult for people to distinguish between real and AI-generated content. As AI-generated media becomes more realistic, maintaining trust in digital content may become increasingly difficult.

Future Trends

In the next 5–10 years, I think AI is going to become a normal part of entertainment and media. Creating music, videos, artwork, and even movies will probably become much easier and faster because of AI tools. People who are not professional musicians, artists, or filmmakers may be able to create high-quality content from their own homes using AI.

I also think streaming services like Netflix and Spotify will continue improving their recommendation systems. AI will likely get even better at understanding what people enjoy and suggesting content based on their interests. We may also see more interactive entertainment where movies, games, or shows can change based on a viewer's choices.

Another possibility is the growth of virtual actors and AI-generated influencers. Companies may create completely digital celebrities that appear in movies, advertisements, and social media. While this could save time and money, it also raises questions about authenticity and whether human performers could lose opportunities.

The biggest challenge will be making sure these technologies are used responsibly. AI has the potential to make entertainment more creative and accessible, but there also needs to be protections against misinformation, privacy violations, and misuse of people's likenesses.

Finding the right balance between innovation and responsibility will be important as the technology continues to grow.

Personal Reflection

The thing that surprised me most was learning that AI is already being used to recreate deceased actors and even deceased family members. I knew deepfakes existed, but I did not realize companies were offering services that allow people to interact with AI-generated versions of loved ones who have passed away. I can understand why some people find comfort in that, but it also made me think about the ethical concerns and whether it could make it harder for some people to process grief.

I think I would be interested in working in this industry because the technology is constantly changing and creating new possibilities. AI can help people be more creative and make content creation more accessible. At the same time, I believe there should always be a place for human creativity and decision-making. Overall, I think AI will continue to play a major role in entertainment, but it is important to use it in ways that are ethical, transparent, and beneficial to society.
